Fortinet SSL-VPN under macOS
Stand: b’19. August 2021’

1 Preamble

This tutorial is created under macOS Big Sur 11.2 The individual steps should(!) work with any macOS from version 10.12+.
To use Fortinet SSL-VPN according to this guide you need:

- a working Internet connection on your Mac (e.g. via WLAN),
- an account at the CMS or the Institute for Computer Science, Mathematics or Physics and
- administrative rights on your Mac.

2 Installation

Download the installer FortiClient_SSL-VPN-HUB.dmg for Fortinet SSL-VPN from the CMS website.
Start the installer and click on **Install**.

Click **Continue**.

Click **Continue**.
Click **Accept**.

Click **Install**.

You will be asked for the password of your macOS user account.

Exit the installer with **Close**.
You will be asked if you want to put the installer in the trash. You can confirm this.

Now start FortiClient. Accept the terms of use.

Now enter your HU-Account and password and click on Connect.
If the connection has been successfully established, this message appears in the upper right corner.
